(08 Marks)
b. A manufacturing Company is producing two products A and B. Each of the products A and $B$ requires the use of two machines P and Q . Product A requires 4 hours of processing in Machine P and 3 hours of processing in Machine Q . Product B requires 3 hours of processing on Machine $P$ and 6 hours of Processing on Machine $Q$. The unit profits of product A and B are Rs. 20 and Rs. 30 respectively. The available time in a given quarter on Machine P is 1000 hours and on Machine Q is 1200 hours. The market survey has predicted 250 units of product $A$ and 300 units of product $B$ can be consumed in a quarter. The company is interested in deciding the product mix to maximize the profits. Formulate the LPP model of this problem.
